However, there is an inherent trade-off and the remaining bits for recording the significant digits in the on-board guidance system. A bug in the code featured in the European Space Agency. The boosters fired up the engines, and the rocket lifted off. The engines fired again, and the rocket continued its ascent. The flight system was designed to be robust and reliable, but this particular mission was a test flight, and there were concerns about the performance of the engines. The launch was critical, as the entire mission relied on the success of this launch. The engineers worked long hours, and the teams were under pressure to deliver a successful mission.
"RUN, DON'T WALK"

"OCEAN"

YOU CAN RUN THE OCEAN

SO MUCH FASTER

"But why are we walking"

And so the story goes, in the beginning...
